

Impact Crusher

Advantages and characteristics

- Regular Size • Easy Adjustment • Simple Structure • High Efficiency

It is one of the main equipment to crush brittle material for coarse medium and finely crushing. For example: shale, sandstone, limestone, dolomite, coal, asbestos, graphite and rock salt. The features of impact crusher are big reduction ratio, high production capacity, product uniform particles, simple crushing circuit, simple structure, easy maintaining and using etc.

Our company has 30 year experience in designing and producing impact crushers. Our impact crushers are popular in domestic and overseas because of advance product design, reliable performance, work smoothly and low energy consumption.

Our impact crusher are divided into Single-rotor impact crusher and Double-rotor impact crusher.

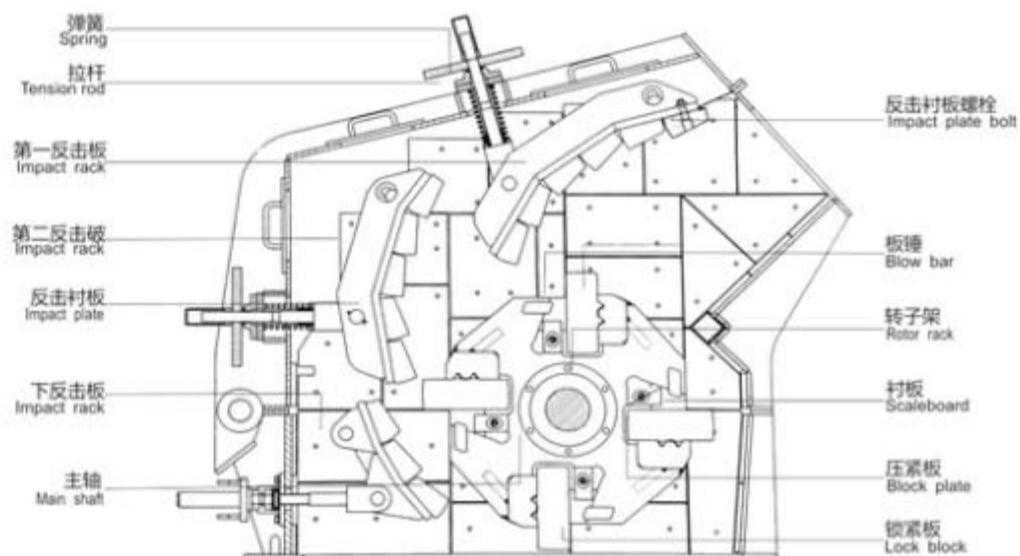

Single-rotor impact crusher consists of racking part, rotor part, back impact plate and front impact plate etc. The motor runs the rotor by V-belt pulley. The upper cavity of frame is installed with front and back impact plate. The stone material is first impacted and crushed by high rotating hammers fixed on rotors and then will be pounded to the front impact plate with big kinetic energy, after which the stone will be crushed again when rebounded to the turning radius of hammers. The crushed stone will be discharged when the stone size is smaller than the gap between the lower liner and the turning radius of hammers.

Double-rotor Impact Crusher adopts two single rotors installed in series. The first rotor is used for rough crushing and the other is for fine crushing. This type of crusher can be used for primary, medium and fine crushing. The Double-rotor Impact Crusher consists of two rotors installed in parallel with height difference between them, frame, two classes of crushing cavities fixed with impacting plates. The two rotors turn in the same direction with a high speed through V-belt pulley by two motors. The first class rotor can usually crush stone from 700mm to 100 mm, after which the 100mm stones can be crushed to below 20mm in the second cavity by the rotor and then will be discharged from the grid tray.

Shunda Impact Crusher is installed with spring adjusting device, which can protect the equipment when iron enters the cavity and may damage machine.
